

Delivery guide

Use this checklist to prepare a clean handoff to the client: code, instructions, and optional prebuilt assets.

1) Verify tests and build

- Server tests (Jest):
 - `cd server && npm ci && npm run test:ci`
- Client tests (Jest):
 - `cd client && npm ci && npm test -- --watchAll=false`
- E2E (Cypress):
 - Option A (no Mongo install): `cd server && npm run start:mem` in one terminal
 - Option B (local Mongo): `CONNECTION_URL=mongodb://localhost:27017/expense_e2e`
`JWT_SECRET=dev npm start`
 - Then: `cd client && npm run build && npx serve -s build -l 3000`
 - Then: `npm run cypress:run`

2) Environment files

- Copy and fill:
 - `server/.env.example -> server/.env`
 - `client/.env.example -> client/.env`

3) Create archives

Produce two zip files: full source and built client.

- Source archive (excluding node_modules, uploads, build, and large docs):
 - `npm run package:source`
 - Result: `dist/expense-tracker-source.zip`
- Client build archive (static site):
 - `cd client && npm run build`
 - `npm run package:client`
 - Result: `dist/expense-tracker-client-build.zip`

4) Hand-off contents

Include:

- The two zip files above
- This repository README and `docs/USER_MANUAL.md`
- A short environment guide with required variables and sample values

5) Post-delivery notes

- Set `PUBLIC_BASE_URL` to the API public URL so receipt links are absolute
- For hosting, ensure `server/uploads/` persists or point uploads to an object store
- For OAuth and Salt Edge, the client must provide production credentials
